Information Disclosure Statement

Applicant is advised that the citation of U.S. patent # 4,987,169 has been crossed out on the PTO-1449 form only because the Examiner wishes to cite this reference himself due to the special acknowledgement given Examiner-cited references on the cover sheet of a patent should this case eventually be patented.

Claim Objections

Claims 1 and 4 are objected to because of the following informalities: In claim 1, the words "lower" and "alkenyl" should be separated. In claim 4, the word "wherein" should be removed. Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 16 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the enablement requirement. The claim(s) contains subject matter that was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. Shearing and mixing are conceptually analogous in that shearing is a form of mixing that generally employs some mechanical means to promote the movement of materials. In this sense, claim 16 is in direct conflict with claim 8 and the disclosure at paragraph 23 as claim 8 discloses mixing until the gelling is discernable and paragraph 23 states

Art Unit: 1712

that mixing is done with a small blade. Therefore, not all of the polymerization is performed in the absence of shearing forces.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 2, 3, and 9 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. It is unclear what precisely is meant by "milled in the swollen stage". Two possible meanings are immediately surmised: (i) milling is carried out thereby bringing about swelling of the gel or (ii) milling of the gel in its swollen *state* is carried out. Based on the Specification, it appears that the latter is true but clarification is needed. For the purpose of evaluating these claims against the prior art, it is assumed that either statement is true.

Claim Analysis

Claim 1 is a product-by-process claim because the phrase "polymerized in the presence of a medium" connotes the preparation of a gel using a specific sequence of steps wherein the organosilicon starting materials are not reacted until a medium has been introduced. However, "[E]ven though product-by-process claims are limited by and defined by the process, determination of patentability is based on the product itself. The patentability of a product does not depend on its method of production. If the product in the product-by-process claim is the same as or obvious from a product of the prior art, the claim is unpatentable even though the prior product was made by a different process" *In re Thorpe*, 777 F.2d 695, 698, 227 USPQ 964, 966 (Fed. Cir.

Art Unit: 1712

1985). Accordingly, a reference need not teach a gel comprising the stated reaction product and medium wherein said product is formed in the presence of the medium for an anticipation to be asserted. Likewise, the limitations of claims 2, 3, and number of subsequent claims need not be expressly taught insofar as these claims are further limiting of the process portion of a base product-by-process claim.

For the purpose of evaluating claim 11, against the prior art, it has been assumed that divinyl complex refers to any complex wherein two vinyl groups are coordinated to the platinum metal center. The exact source of these vinyl moieties is not expressly identified by Applicant hence it will be assumed that both vinyl groups may be provided by the same ligand.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 4-6, 23, and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kuwata et al., U.S. patent # 4,987,169. Kuwata discloses a crosslinked silicone product that may be employed as a thickening agent for silicone oils that are often employed in the formulation of cosmetics (column 2, lines 25-31). The crosslinked product is derived from a mixture of an organohydrogensiloxane characterized in column 3, lines 43-67 through column 4, lines 1-11 and an alkenyl group-functionalized polysiloxane fitting the description offered in column 4, lines 12-39.

Art Unit: 1712

The reaction between these materials is carried out in the presence of a low viscosity silicone oil such as those mentioned in column 5, lines 20-28. According to column 5, lines 29-38, the silicone oil is preferably made available as 20 to 500 parts by weight relative to 100 parts by weight of the crosslinked product precursors. Notably, where the oil is added as better than 425 weight parts the limitation of claim 4 is satisfied. Relevant to the claimed structural limitations of the gel-forming materials, the organohydrogensiloxane is, in a preferred embodiment (Example 1) a linear polysiloxane having trimethylsilyl terminal groups, dimethylsiloxane repeat units, and methylhydrogensiloxane repeat units. The alkenyl group-functionalized polymer is dimethylvinyl-terminated polydimethylsiloxane.

On the other hand, the molecular weights provided for these specific embodiments, do not adhere to the molecular weight requirements of components (A) and (B) of claim 1. Nonetheless, column 4, lines 13-21 states that variable (g), which corresponds to "n" of component (B) of the claimed invention may equal 0 to 500. Likewise, column 3, lines 43-51 contemplate an organohydrogensiloxane wherein variable (c) corresponding to "p" of the instant invention is 0 to 500 and (d) corresponding to "q" of the instant invention is 0 to 50. The fact that (i) these ranges fully encompasses the claimed ranges and, in the Examiner's view, do so with specific specificity coupled with (ii) Applicant's failure to demonstrate criticality for the claimed ranges renders these aspects of the claimed invention obvious. "A prior art reference that discloses a range encompassing a somewhat narrower claimed range is sufficient

Art Unit: 1712

to establish a prima facie case of obviousness." *In re Peterson* 315 F.3d 1325, 1330, 56USPQ2d 1379, 1382-83 (Fed Cir. 2003).

As for claim 6, equivalent gels, their dilution with a low-viscosity silicone oil, and their utilization in the formulation of cosmetics are all contemplated. Cosmetically acceptable ingredients are not expressly mentioned but the skilled artisan will appreciate that these adjuvants are to be combined with the gel whenever it is employed in cosmetics production. The amounts of the gel, diluent, and cosmetically, acceptable ingredients are also not contemplated but ready determination of these parameters is not beyond the capabilities of one having ordinary skill. "Discovering an optimum value of a result effective variable involves only routine skill in the art." *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

As for claim 33, it is noted that Applicant has not identified a single material that is envisioned to be "suitable for application to rubber or rubber-like surfaces. This is significant because it represents, in the Examiner's view, an admission that thes materials are known to the skilled artisan. While the reference does not contemplate applying their gel to the surface of a rubber article, it is considered that said gel maybe incorporated into a rubber (column 2, lines 35-37). In doing so, it is inherently combined with other materials that are suitable for the rubber.

Concerning claims 2, 3, 7, 9-10, 12-15, 17-22, 24-27, and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kuwata et al., U.S. patent # 4,987,169 in view of the dictionary definition of "mill" taken from Merriam-Webster's Dictionary.

Concerning claim 7, the reference teaches the preparation of a paste or grease derived

Art Unit: 1712

from an equivalent gel at column 6, lines 31-68 through column 7, lines 1-32. The process entails polymerization of structurally equivalent organosilicon starting materials in the presence of a platinum hydrosilylation catalyst and the low viscosity silicone oil at 50-150° C. Thereafter, it is stated that the resulting powder is subjected to a shearing force that results in the powder being further ground but "milling" of said powder is never expressly mentioned. However, "mill", according to Merriam Webster's Dictionary, may refer to a machine for crushing or comminuting. By extension, "milling" would refer to the act of crushing or comminuting, which are synonomous with "grinding". That is, although the reference does not disclosing sending the powder through a milling device per se, said powder is, nonetheless, ground or milled by the applied shearing forces. On the other hand, the reference teaches the subsequent treatment of the powder with more of the low-viscosity silicone under shearing forces. Shearing in this instance is carried out in, among other devices, a colloid mill. It seems unlikely that the shearing devices outlined in column 7, lines 26-29 are for the second shearing operation exclusively but, ultimately, the exact intentions of the reference cannot be ascertained. It is, nevertheless, the Examiner's contention that one of ordinary skill would infer from the reference that the first milling operation could also be performed with the same apparatus hence claims 3 and 9 are also rejected.

As for claim 13, the polymerization reaction is carried out for two hours in the particular embodiment recited in Example 1. Claims 14 and 15 are rejected because, though a polymerization time of only two hours is disclosed by way of Example, this should not be taken as an express limit on the recommended polymerization duration.

Art Unit: 1712

Indeed, the reference does not provide any suggestion of a range of polymerization times. This omission notwithstanding, the skilled artisan can determine the required polymerization time as a matter of routine experimentation.

Claims 19-27 are clearly obvious in view of the previous discussion.

As for claims 28 and 29, the gels and the paste/grease derived therefrom, are characterized as being transparent in column 2, lines 28-47.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kuwata et al., U.S. patent # 4,987,169 in view of Karstedt et al., U.S. Patent # 3,775,442. Kuwata et al. identify the catalysts of Karstedt as appropriate for use in their invention. These catalysts according to the supporting reference are divinylsiloxane complexe4s of platinum.

Allowable Subject Matter

Claims 8 and 30-32 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims. The polymerization process taught by the reference involves mixing throughout. As for claims 30-32, the reference teaches formulating the gel *into* a rubber, not applying the gel *onto* its surface.

Claim 16 would be allowable if rewritten to overcome the rejection(s) under 35 U.S.C. 112, first paragraph, set forth in this Office action and to include all of the

Art Unit: 1712

Page 9

limitations of the base claim and any intervening claims. Applicant must point to support for this embodiment as the Specification would appear to not be enabling.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Marc S. Zimmer whose telephone number is 571-272-1096. The examiner can normally be reached on Monday-Friday 8:00-4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Randy Gulakowski can be reached on 571-272-1302. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
